

A Smarter Way To License Research Articles For AI

Offer subscribers instant and cited access to your articles across all major LLMs, without giving AI full access to your content.

Challenge:

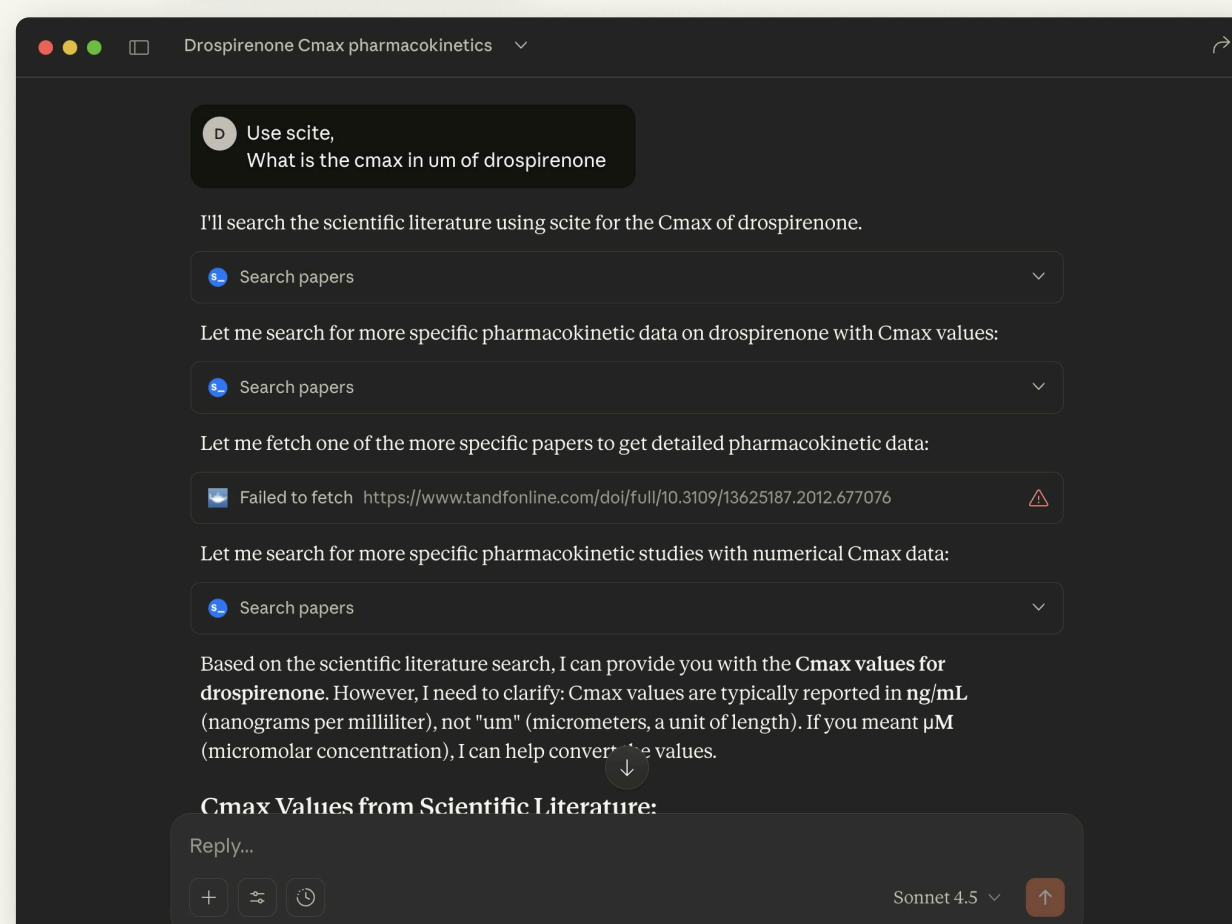

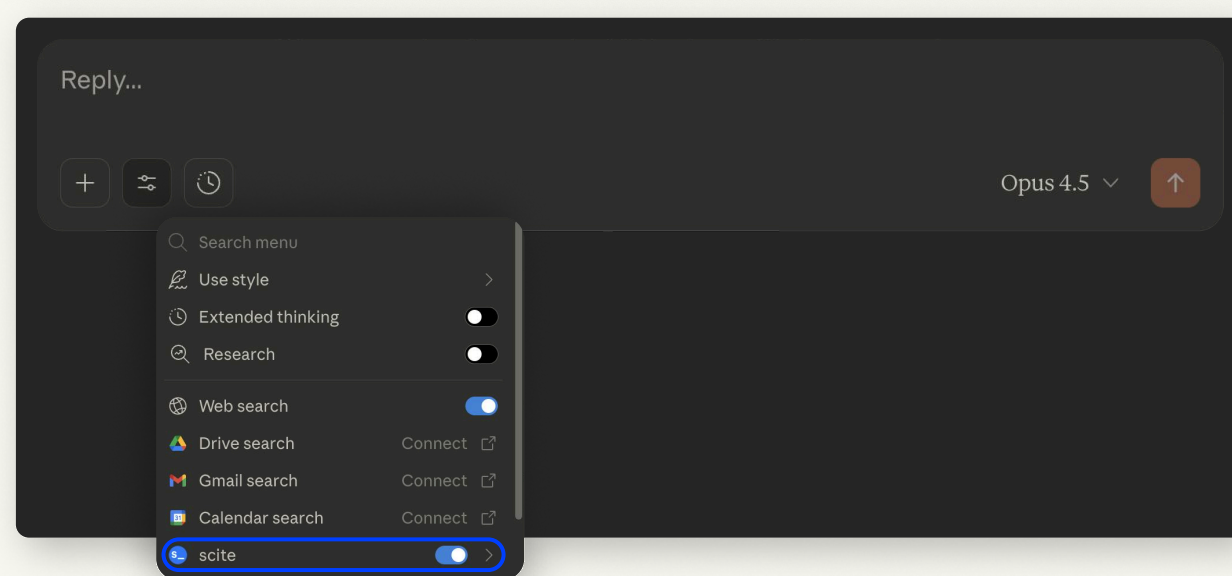

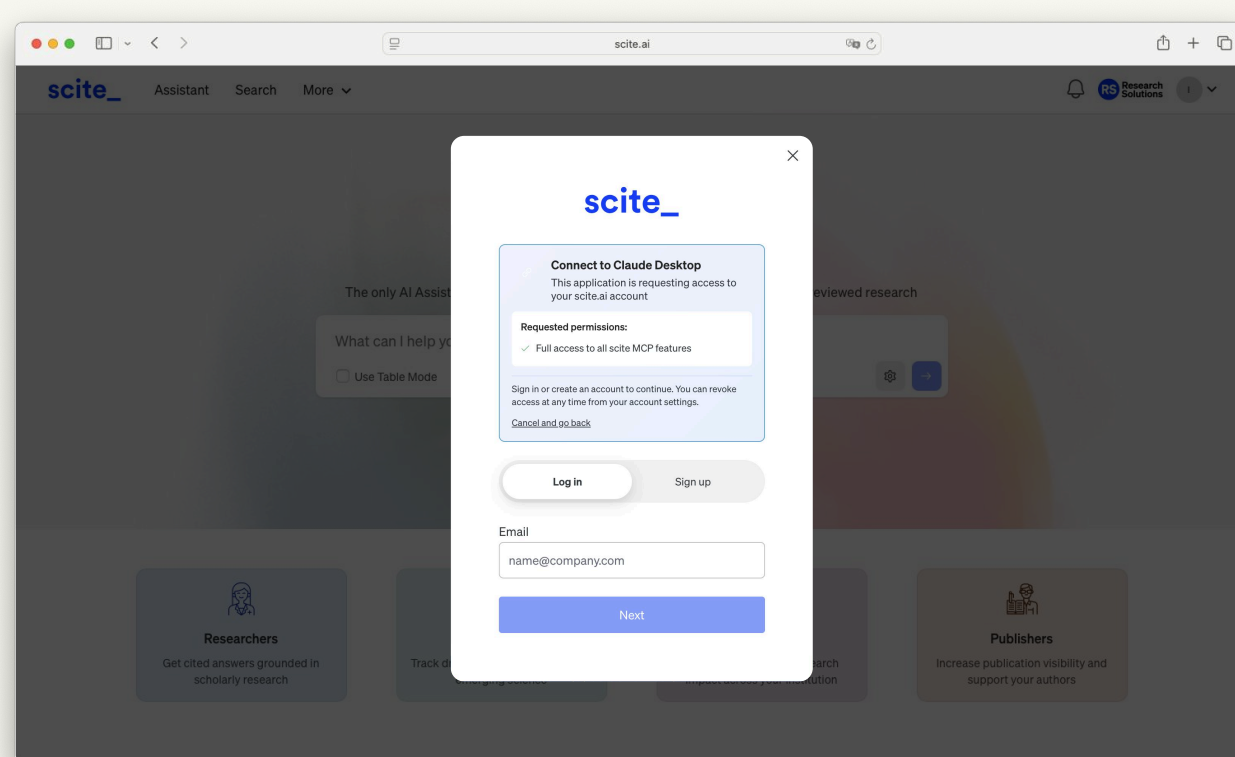

Your institutional subscribers want to use AI tools with your content.

Solution:

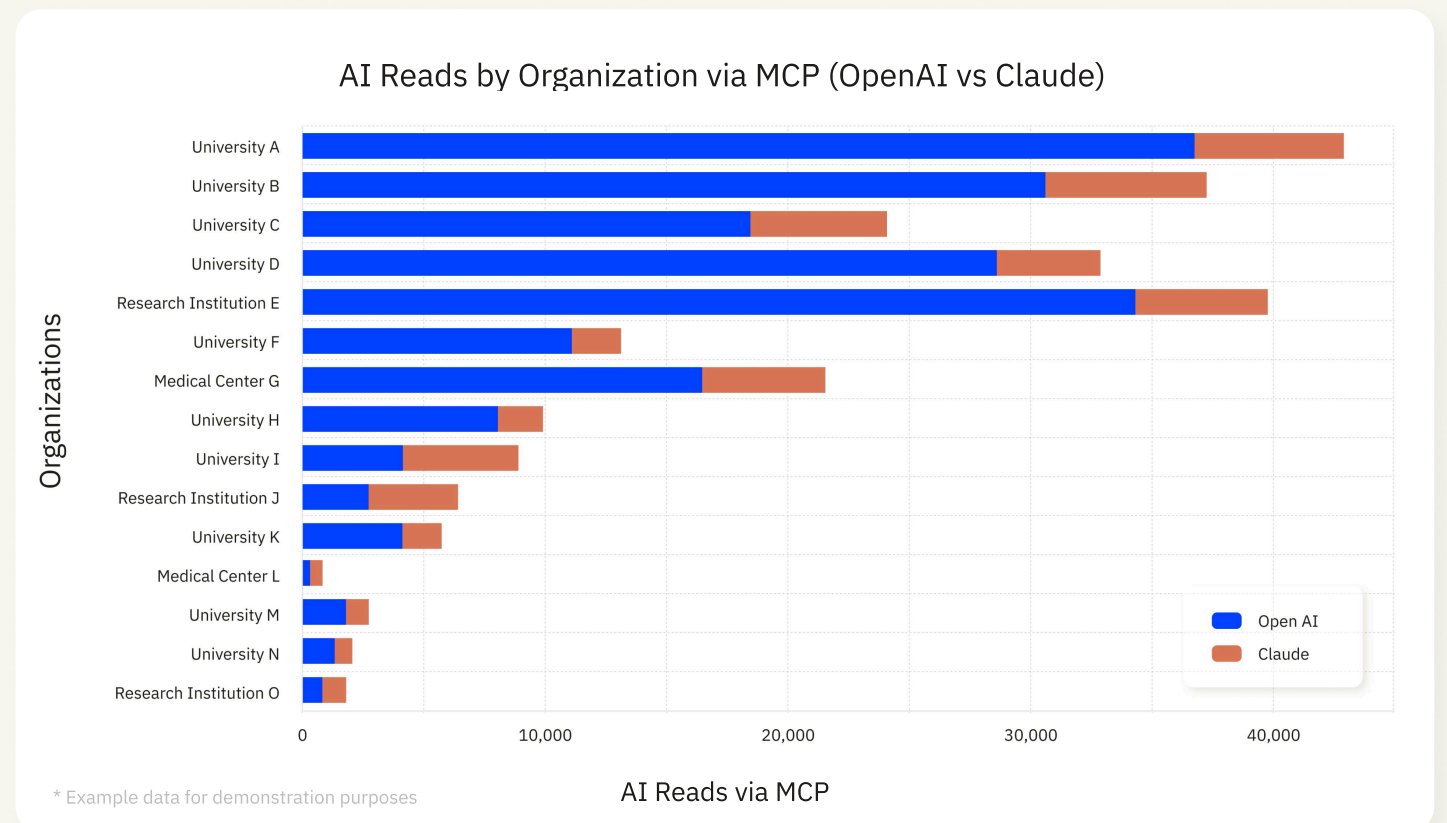

An MCP integration that delivers enrichment to any LLM while maintaining subscription entitlements and protecting your articles from unauthorized access.

How It Works

1. Scite works as your technology partner. Scite delivers the content you choose to any customer as an upsell, managing authentication and subscription entitlements throughout. Scite handles article transformation, indexing, usage tracking, and integrations into any LLM.
2. Scite surfaces Smart Citations to the LLM. This means only snippets of your content are ever used by the LLM, protecting your Version of Record and incentivizing readers to access the full text. Scite optionally allows you to provide full text where you see fit, or not at all.
3. Your content becomes discoverable in the fastest growing tool ever in a protected, controlled, and measured environment.

4. View detailed analytics on which articles subscribers access via AI. Track article-level usage at the organization level across all major LLMs (Claude, ChatGPT, and more), enabling you to identify non-adopting customers for targeted outreach and demonstrate subscription value to high-usage organizations.

Your Content Stays Protected

Unlike competitors charging publishers upfront fees, our MCP architecture ensures AI tools can surface and cite your content, but never train on or retain it. You maintain full control of your Version of Record.

That control also ensures accuracy. Our MCP architecture prevents LLMs from hallucinating or misrepresenting your content. Every AI response links directly to verified article text, ensuring your research is accurately represented rather than fabricated.

Publisher Benefits

No Upfront Costs: flat fee per customer maintains subscription value

Publisher Neutral: works across all participating publishers

Usage Analytics: see which articles subscribers access via AI

Multi-Platform Support: Claude, ChatGPT, and more

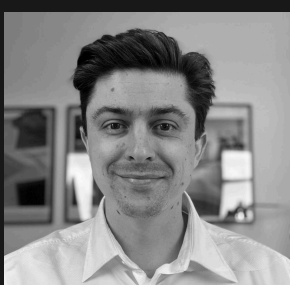

Smart Citations: every AI response links back to your content

Simple Indexing: learn how indexing enhances discoverability
