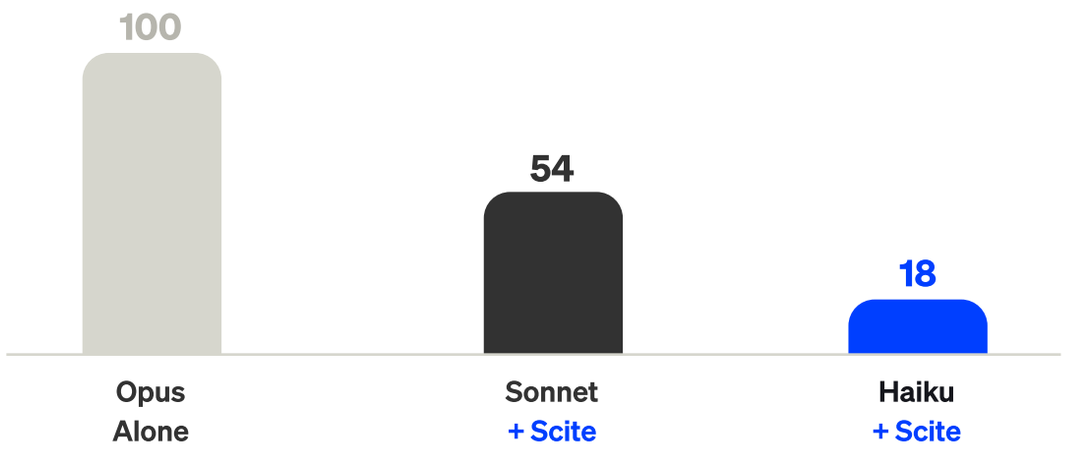
Scite For Research Teams

Cut AI Costs Without Sacrificing Quality

Scientific accuracy comes from **sources, not model size**. Scite provides verified literature and citation context, so a smaller model performs like a bigger one on the work that matters.

Stop running your most expensive models just to look up papers and verify evidence. Pair a lower cost model like **Claude Haiku or Sonnet with the Scite MCP** to deliver grounded answers up to **5x cheaper**, with fewer hallucinations.

Cost Per Answer



Indexed to Opus = 100; illustrative, based on list token prices.

How It Works

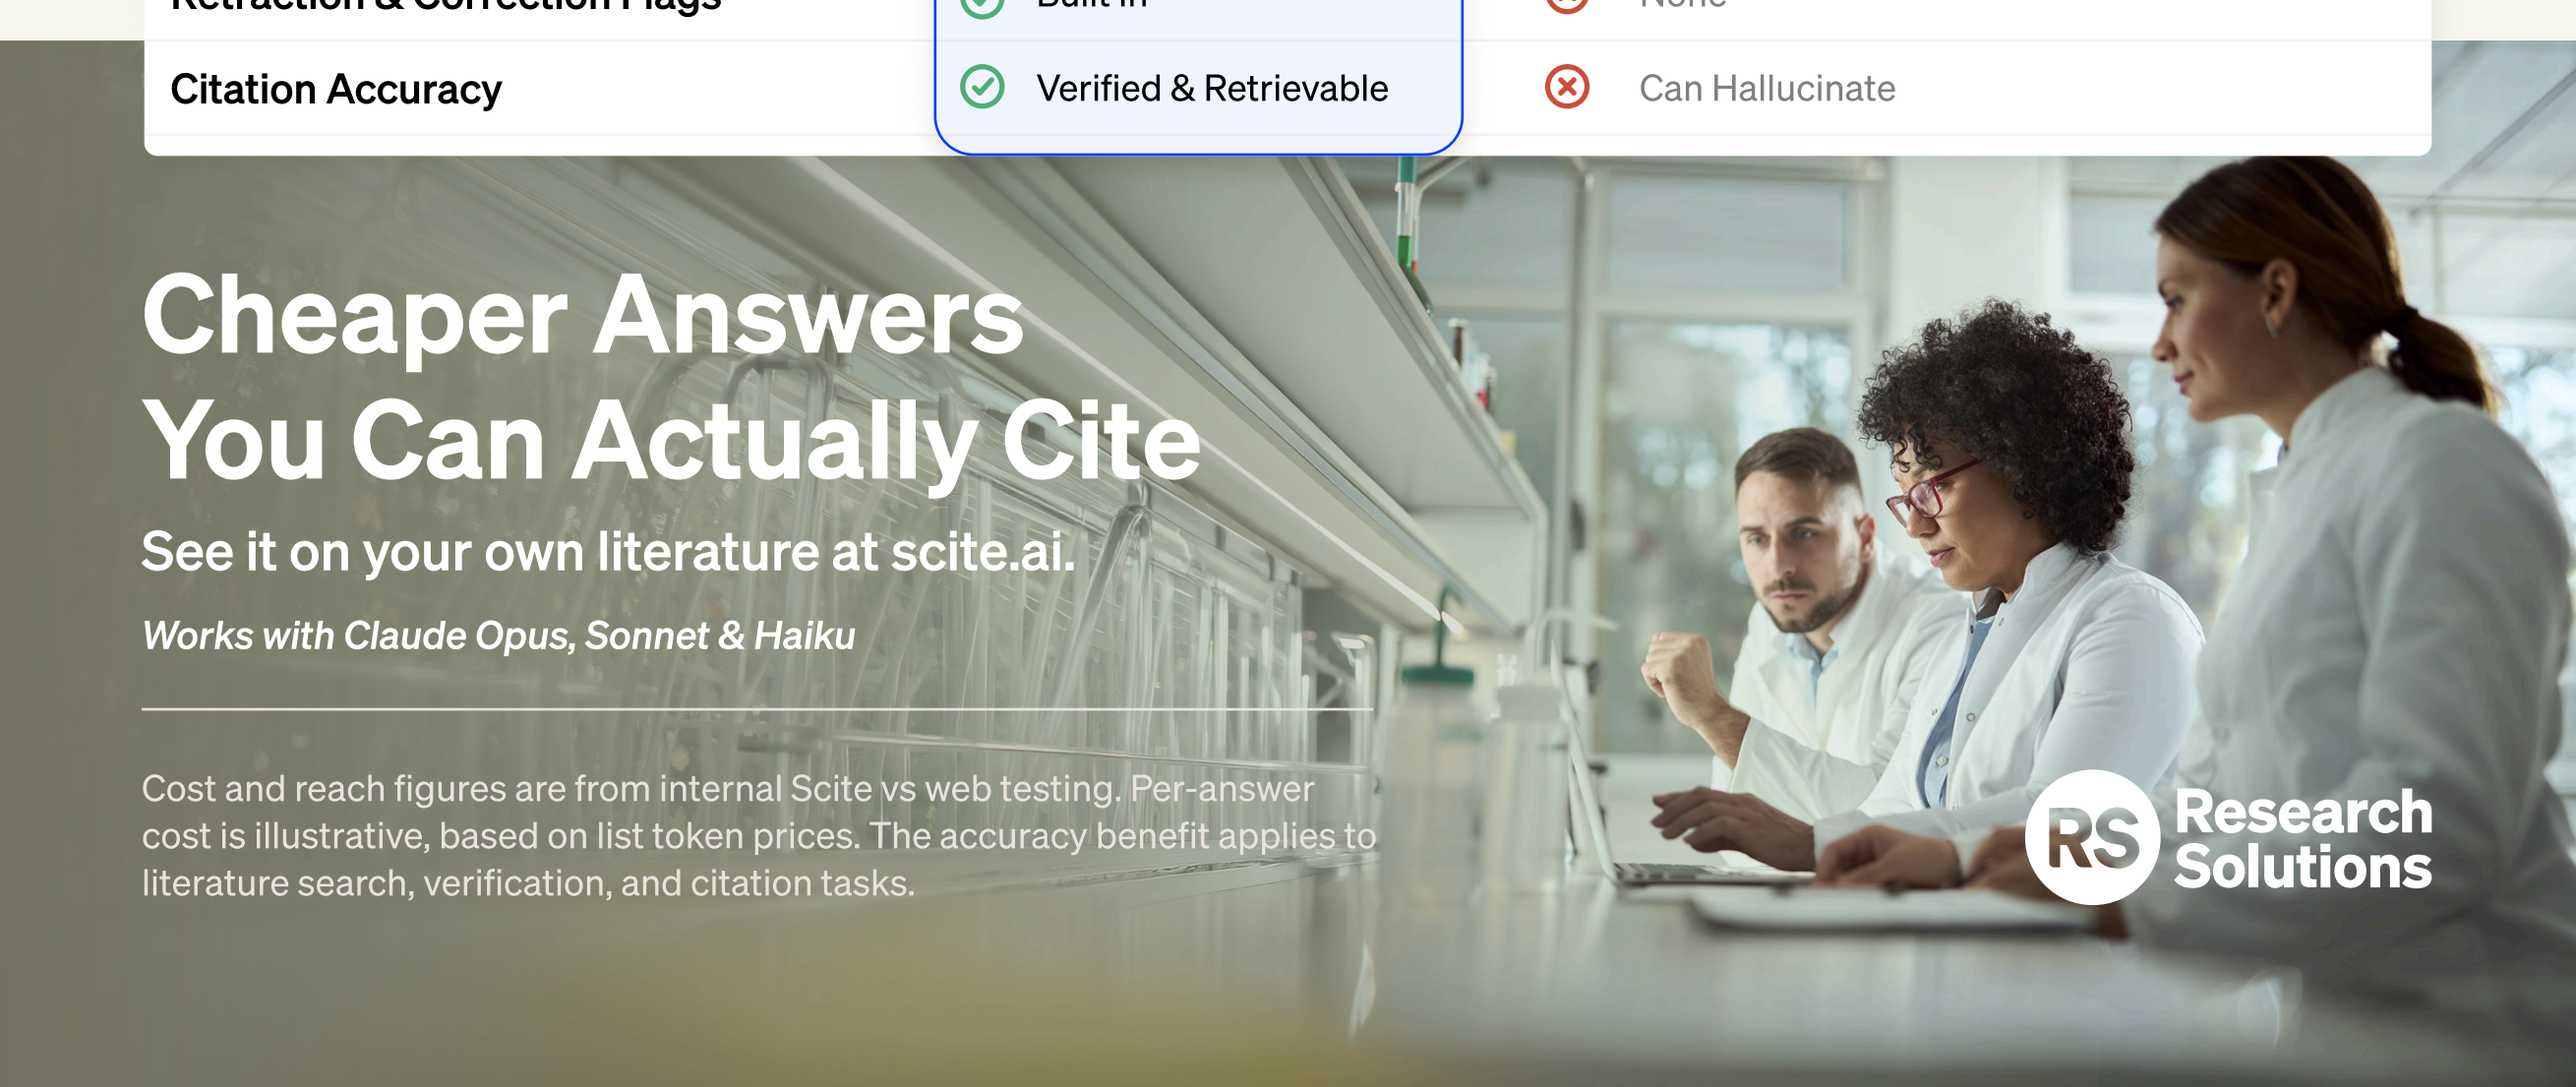
01 Ask a research question, or paste a **claim or reference** to verify.

02 Scite retrieves **verified papers**, supporting and contrasting citations, and retraction flags, all in one call.

03 The model summarizes and cites. **Done, on a cheaper tier.**

To Verify One Claim

	Scite	Letting The Model Search The Web
Calls Needed	✓ 1 Call	3-4 Round Trips
Sources Actually Reached	✓ 100%	✗ About 1 In 3 (Rest Paywalled Or Blocked)
Evidence Per Claim	✓ ~15k Tokens, Structured	200k+ Tokens Of Raw Page HTML
Supporting vs Contrasting	✓ Classified As Data	✗ You Read & Infer
Retraction & Correction Flags	✓ Built In	✗ None
Citation Accuracy	✓ Verified & Retrievable	✗ Can Hallucinate



Cheaper Answers You Can Actually Cite

See it on your own literature at scite.ai.

Works with Claude Opus, Sonnet & Haiku

Cost and reach figures are from internal Scite vs web testing. Per-answer cost is illustrative, based on list token prices. The accuracy benefit applies to literature search, verification, and citation tasks.
